

Optimize Something

Umar Rafi
urafi3@gatech.edu

Abstract— This project focuses on developing an automated system to optimize investment portfolios by determining the ideal distribution of funds across selected stocks to maximize returns while minimizing risk. It involves analyzing historical stock data to calculate key performance indicators and generate visual comparisons between the optimized portfolio and market benchmarks. The implementation emphasizes practical application of financial concepts through programming, requiring careful attention to mathematical accuracy and computational efficiency. The project serves as an important step in building algorithmic trading systems, combining financial theory with technical implementation to create a tool for data-driven investment decision-making.
